

Reduced efficiency of UV system at Troy, Ohio, WWTP restored by Algae Sweeps

"We installed a UV disinfection system in '97," says Mark Livengood, Utilities Supervisor of Troy, Ohio's, WWTP. "But we soon found ourselves having to acid-clean the modules every month, because their efficiency was being reduced by all the algae we were having to clean off our clarifiers. So, in '99 and 2000, we installed Algae Sweeps on all of our clarifiers and we haven't had to pull a UV module since. We're now saving about \$50,000 a year, which is what it was costing us to have a man spend 40 hours a week manually cleaning algae off clarifiers. We don't have to use chemicals to keep the clarifiers clean. And nobody's safety is at risk. **Algae Sweeps ought to be mandated for all plant expansions and upgrades.**"

YOU SHOULD KNOW THIS: Over 1,400 Algae Sweeps have been installed (turn-key) in more than 500 WWTPs in 44 states. For a complete list of installations and a **free demonstration video**, visit our Web site, or call us today at 800.928.2070.
